

CLAIM AMENDMENTS

1. (canceled)

2. (previously presented) The method according to claim 16 wherein said channel coefficients to be calculated are comprised between a first known channel coefficient, of abscissa A, corresponding to a last pilot symbol of a current slot (L) and a second known channel coefficient, of abscissa B, corresponding to a first pilot symbol of a slot (L + 1) subsequent to said current slot, a third channel coefficient of abscissa A-1 being on the left-hand of said first channel coefficient of abscissa A, and the computation of said channel coefficients being carried out by the following steps:

a) carrying out a first iteration in an interval defined by the known channel coefficients of abscissa A and B in which a first intermediate coefficient is calculated and performing subsequent iterations in sub-intervals defined each time on the left-hand by said known channel coefficient of abscissa A and on the right-hand by the intermediate coefficient and calculated in the preceding iteration, until the abscissa point A + 1 is reached and computed;

b) searching, by increasing abscissas, for a first point, still to be calculated, on the right-hand of the last intermediate coefficient calculated; defining as extremes of a new interval

22 having on the left side the first known left-hand point and on the
23 right side the first known right-hand point with respect to said
24 point still to be calculated; and further recursively performing
25 further iterations of the method in said new interval by carrying
26 out subsequent iteration in sub-intervals defined from time to time
27 by the intermediate coefficient calculated in the preceding
28 iteration, until the point immediately adjacent to the left-hand
29 extreme of said new interval is reached and calculated; and
30 c) repeating step b) until the channel coefficient
31 associated to the value of abscissa B-1 is calculated.

1 3. (previously presented) The method according to claim
2 2 wherein each slot contains three pilot symbols (0, 1, 2), said
3 first known channel coefficient of abscissa A is the coefficient
4 $C(2) = C_i(2) + C_o(2)$ corresponding to the last pilot symbol (2) of
5 the current slot (L), said second known channel coefficient of
6 abscissa B is the coefficient $C(10) = C_i(10) + jC_o(10)$ corresponding
7 to the first pilot symbol (10) of a subsequent slot (L + 1), and
8 said third known channel coefficient of abscissa A-1 is the
9 coefficient $C(1) = C_i(1) + C_o(1)$ corresponding to the last but one
10 pilot symbol (1) of the current slot (L) and the computation of
11 channel coefficients $C(k) = C_i(k) + jC_o(k)$, with $k = 3..9$, is
12 performed according to the following sequence:

$$\begin{aligned} C_i(6) &= [C_i(2) + C_i(10)]/2; & C_o(6) &= [C_o(2) + C_o(10)]/2; \\ C_i(4) &= [C_i(2) + C_i(6)]/2; & C_o(4) &= [C_o(2) + C_o(6)]/2; \end{aligned}$$

$$\begin{aligned}
 C_I(3) &= [C_I(2) + C_I(4)]/2 ; C_Q(3) = [C_Q(2) + C_Q(4)]/2 ; \\
 C_I(5) &= [C_I(4) + C_I(6)]/2 ; C_Q(5) = [C_Q(4) + C_Q(6)]/2 ; \\
 C_I(8) &= [C_I(6) + C_I(10)]/2 ; C_Q(8) = [C_Q(6) + C_Q(10)]/2 ; \\
 C_I(7) &= [C_I(6) + C_I(8)]/2 ; C_Q(7) = [C_Q(6) + C_Q(8)]/2 ; \\
 C_I(9) &= [C_I(8) + C_I(10)]/2 ; C_Q(9) = [C_Q(8) + C_Q(10)]/2 .
 \end{aligned}$$

4. (previously presented) The method according to claim 2 wherein each slot contains four pilot symbols (0, 1, 2, 3), said first known channel coefficient of abscissa A is the coefficient $C(3) = C_I(3) + jC_Q(3)$ corresponding to the last pilot symbol (3) of the current slot (L), said second known channel coefficient of abscissa B is the coefficient $C(10) = C_I(10) + jC_Q(10)$ corresponding to the first pilot symbol (10) of a subsequent slot (L + 1), and said third known channel coefficient of abscissa A-1 is the coefficient $C(2) = C_I(2) + jC_Q(2)$ corresponding to the last but one pilot symbol (2) of the current slot (L), and the computation of the channel coefficients $C(k) = C_I(k) + jC_Q(k)$, with $k = 4..9$, is performed according to the following sequence:

$$\begin{aligned}
 C_I(6) &= [C_I(2) + C_I(10)]/2 ; C_Q(6) = [C_Q(2) + C_Q(10)]/2 ; \\
 C_I(4) &= [C_I(2) + C_I(6)]/2 ; C_Q(4) = [C_Q(2) + C_Q(6)]/2 ; \\
 C_I(5) &= [C_I(4) + C_I(6)]/2 ; C_Q(5) = [C_Q(4) + C_Q(6)]/2 ; \\
 C_I(8) &= [C_I(6) + C_I(10)]/2 ; C_Q(8) = [C_Q(6) + C_Q(10)]/2 ; \\
 C_I(7) &= [C_I(6) + C_I(8)]/2 ; C_Q(7) = [C_Q(6) + C_Q(8)]/2 ; \\
 C_I(9) &= [C_I(8) + C_I(10)]/2 ; C_Q(9) = [C_Q(8) + C_Q(10)]/2 .
 \end{aligned}$$

1 5. (previously presented) The method according to claim
2 2 wherein each slot contains five pilot symbols (0, 1, 2, 3, 4),
3 said first known channel coefficient of abscissa A is the
4 coefficient $C(4) = C_I(4) + jC_Q(4)$ corresponding to the last pilot
5 symbol (4) of current slot (L), said second known channel
6 coefficient of abscissa B is the coefficient
7 $C(10) = C_I(10) + jC_Q(10)$ corresponding to the first pilot symbol
8 (10) of a subsequent slot (L + 1), and said third known channel
9 coefficient of abscissa A-1 is the coefficient $C(3) = C_I(3) + jC_Q(3)$
10 corresponding to the last but one pilot symbol (3) of the current
11 slot (L), and the computation of the channel coefficients
12 $C(k) = C_I(k) + jC_Q(k)$, with $k = 5..9$, is performed according to
13 following sequence:

$$\begin{aligned} C_I(7) &= [C_I(4) + C_I(10)]/2; & C_Q(7) &= [C_Q(4) + C_Q(10)]/2; \\ C_I(5) &= [C_I(3) + C_I(7)]/2; & C_Q(5) &= [C_Q(3) + C_Q(7)]/2; \\ C_I(6) &= [C_I(5) + C_I(7)]/2; & C_Q(6) &= [C_Q(5) + C_Q(7)]/2; \\ C_I(8) &= [C_I(6) + C_I(10)]/2; & C_Q(8) &= [C_Q(6) + C_Q(10)]/2; \\ C_I(9) &= [C_I(8) + C_I(10)]/2; & C_Q(9) &= [C_Q(8) + C_Q(10)]/2. \end{aligned}$$

1 6. (previously presented) The method according to claim
2 2 wherein each slot contains six pilot symbols (0, 1, 2, 3, 4, 5),
3 said first known channel coefficient of abscissa A is the
4 coefficient $C(5) = C_I(5) + jC_Q(5)$ corresponding to the last pilot
5 symbol (5) of the current slot (L), said second known channel
6 coefficient of abscissa B is the coefficient

7 $C(10) = C_i(10) + jC_q(10)$ corresponding to the first pilot symbol
 8 (10) of a subsequent slot (L + 1), and said third known channel
 9 coefficient of abscissa A-lis the coefficient $C(4) = C_i(4) + jC_q(4)$
 10 corresponding to the last but one pilot symbol (4) of the current
 11 slot (L), and the computation of the channel coefficients
 12 $C(k) = C_i(k) + jC_q(k)$, with $k = 6..9$, is performed according to
 13 following sequence:

$$C_i(7) = [C_i(4) + C_i(10)]/2; C_q(7) = [C_q(4) + C_q(10)]/2;$$

$$C_i(6) = [C_i(5) + C_i(7)]/2; C_q(6) = [C_q(5) + C_q(7)]/2;$$

$$C_i(8) = [C_i(6) + C_i(10)]/2; C_q(8) = [C_q(6) + C_q(10)]/2;$$

$$C_i(9) = [C_i(8) + C_i(10)]/2; C_q(9) = [C_q(8) + C_q(10)]/2.$$

1 7. (previously presented) The method according to claim
 2 2 wherein each slot contains seven pilot symbols (0, 1, 2, 3, 4, 5,
 3 6), said first known channel coefficient of abscissa A is the
 4 coefficient $C(6) = C_i(6) + jC_q(6)$ corresponding to the last pilot
 5 symbol (6) of the current slot (L), said second known channel
 6 coefficient is the coefficient $C(10) = C_i(10) + jC_q(10)$
 7 corresponding to the first pilot symbol (10) of a subsequent slot
 8 (L + 1), and said third known channel coefficient of abscissa A-1
 9 is the coefficient $C(5) = C_i(5) + jC_q(5)$ corresponding to the last
 10 but one pilot symbol (5) of the current slot (L), and the
 11 computation of the channel coefficients $C(k) = C_i(k) + jC_q(k)$, with
 12 $k = 7..9$, is performed following the sequence:

$$C_i(8) = [C_i(6) + C_i(10)]/2; C_q(8) = [C_q(6) + C_q(10)]/2;$$

$$C_I(7) = [C_I(6) + C_I(8)]/2 ; C_Q(7) = [C_Q(6) + C_Q(8)]/2 ;$$

$$C_I(9) = [C_I(8) + C_I(10)]/2 ; C_Q(9) = [C_Q(8) + C_Q(10)]/2 .$$

8. (previously presented) The method according to claim 2, wherein each slot contains eight pilot symbols (0, 1, 2, 3, 4, 5, 6, 7), said first known channel coefficient of abscissa A is the coefficient $C(7) = C_I(7) + jC_Q(7)$ corresponding to the last pilot symbol (7) of the current slot (L), said second known channel coefficient of abscissa B is the coefficient $C(10) = C_I(10) + jC_Q(10)$ corresponding to the first pilot symbol (10) of a subsequent slot (L + 1), and said third known channel coefficient of abscissa A-1 is the coefficient $C(6) = C_I(6) + jC_Q(6)$ corresponding to the last but one pilot symbol (6) of the current slot (L), and the computation of the channel coefficients $C(k) = C_I(k) + jC_Q(k)$, with $k = 8, 9$, is performed according to the sequence:

$$C_I(8) = [C_I(6) + C_I(10)]/2 ; C_Q(8) = [C_Q(6) + C_Q(10)]/2 ;$$

$$C_I(9) = [C_I(8) + C_I(10)]/2 ; C_Q(9) = [C_Q(8) + C_Q(10)]/2 .$$

9. (previously presented) The method according to claim 17 wherein said channel coefficients to be calculated are comprised between a first known channel coefficient of abscissa A, corresponding to a last pilot symbol of a current slot (L), and a second known channel coefficient of abscissa B, corresponding to a first pilot symbol of a slot (L + 1) subsequent to said current

7 slot, a third channel coefficient of abscissa $B + 1$ being on the
8 right hand of said first channel coefficient of abscissa B , and the
9 computation of said channel coefficients is performed by the steps
10 of:

11 a) carrying out a first iteration in the interval defined
12 by the known channel coefficients of abscissa A and B in which a
13 first intermediate coefficient is calculated and performing
14 subsequent iterations in sub-intervals defined from time to time on
15 the right-hand by said known channel coefficient of abscissa B and
16 on the left-hand by the intermediate coefficient calculated in the
17 preceding iteration, until the abscissa point $B - 1$ is reached and
18 calculated;

19 b) searching, by decreasing abscissas, for a first point
20 still to be calculated on the left-hand of the last intermediate
21 coefficient calculated; defining a new interval having on the left
22 side the first known left hand point and on the right side the
23 first known right-hand point with respect to said point still to be
24 calculated; and recursively calculating further iterations of the
25 method in said new interval by carrying out subsequent iterations
26 in sub-intervals defined from time to time by the right hand
27 extreme of said new interval and by a left hand extreme formed by
28 the intermediate coefficient derived in the previous iteration,
29 until the point immediately adjacent to the right hand extreme of
30 said new interval is reached and calculated; and

31 c) repeating step b) until the channel coefficient
32 associated to the value of abscissa $A + 1$ is calculated.

1 10. (previously presented) The method according to
2 claim 16, wherein said channel coefficients to be calculated are
3 comprised between two known left-hand channel coefficients ($A - 1$,
4 A) corresponding to the last two pilot symbols of a current slot
5 (L), and two known right-hand channel coefficients (B , $B + 1$)
6 corresponding to the first two pilot symbols of a slot ($L + 1$)
7 subsequent to said current slot, and the computation of said
8 channel coefficients is performed by applying the first time
9 iterative method of claim 16 for calculating an intermediate
10 coefficient, thus dividing into two sub-intervals the interval
11 comprised between said known left-hand channel coefficients and
12 said known right hand channel coefficients, and by subsequently
13 applying in parallel to said the iterative method of claim 16 for
14 computing the remaining channel coefficients comprised in each of
15 said sub-intervals.

1 11. (previously presented) The method according to
2 claim 16 wherein at least one known point of said first or second
3 extreme is a point which has been obtained through a linear
4 combination of known channel coefficients.

1 12. (previously presented) The method according to
2 claim 16 wherein said communications network is a radio mobile
3 telecommunications network of UMTS type.

1 13. (previously presented) A device for the estimation
2 of the transfer function of a transmission channel in a receiving
3 system for a telecommunications network, the device comprising:

4 a memory means for storing channel coefficients
5 corresponding to a current slot (L) and at least one channel
6 coefficient corresponding to a slot (L + 1) subsequent to said
7 current slot (L);

8 interpolation means for reading from said memory means
9 first and second operands corresponding to known channel
10 coefficients and for writing into said memory means a value
11 corresponding to the arithmetic average between said first and
12 second operand, said value corresponding to a new channel
13 coefficient;

14 logic control means for addressing in reading and writing
15 (R/W) said memory means and for controlling said interpolation
16 means so as to perform through individual interpolation operations
17 the computation and the storage into such memory means of
18 individual channel coefficients, said logic control carrying out a
19 series of interpolation operations according to the method
20 described in claim 16.

1 14. (previously presented) A radio base station of the
2 type comprising a Rake receiver for receiving signals coming from
3 mobile terminals and equipped with a device for the estimation of
4 the transfer function of a transmission channel through the
5 computation of a plurality of channel coefficients, the estimation
6 of the transfer function being performed according to the method
7 described in claim 16.

1 15. (previously presented) A mobile terminal of the
2 type comprising a receiver for the reception of signals coming from
3 a radio base station and equipped with a device for the estimation
4 of the transfer function of a transmission channel through the
5 computation of a plurality of channel coefficients, the estimation
6 of the transfer function being performed according to the method
7 described in claim 16.

1 16. (currently amended) An iterative method of
2 estimating channel coefficients by interpolation between known
3 channel coefficients, the coefficients being identified by integer
4 abscissa values on a time axis, the known coefficients comprising
5 at least two coefficients with adjacent abscissa values $x-1$ and x
6 at the left side of an interval and at least one coefficient with
7 abscissa value y at the right of the interval, wherein one
8 iteration of the method comprises

9 calculating an abscissa value as $z = \lfloor (x+y)/2 \rfloor$
10 $z = \text{FLOOR}[(x+y)/2]$, and
11 calculating the coefficient with abscissa z as the
12 arithmetic mean of the coefficients with abscissae values x and y ,
13 if $x + y$ is even, and as the arithmetic mean of the coefficients
14 with abscissae values $x-1$ and y , if $x + y$ is odd, the coefficient
15 with abscissa z constituting a known coefficient for any further
16 iterations.

1 17. (currently amended) An iterative method of
2 estimating channel coefficients by interpolation between known
3 channel coefficients, the coefficients being identified by integer
4 abscissa values on a time axis, the known coefficients comprising
5 at least one coefficient with abscissa value x at the left side of
6 an interval and at least two coefficients with adjacent abscissa
7 values y and $y + 1$ at the right of the interval wherein one
8 iteration of the method comprises

9 calculating an abscissa value as $z = \lceil (x+y)/2 \rceil$
10 $z = \text{CEIL}[(x+y)/2]$, and

11 calculating the coefficient with abscissa z as the
12 arithmetic mean of the coefficients with abscissae values x and y ,
13 if $x + y$ is even, and as the arithmetic mean of the coefficients
14 with abscissas values x and $y + 1$, if $x + y$ is odd, the coefficient
15 with abscissa z constituting a known coefficient for any further
16 iterations.

1 18. (canceled)

1 19. (previously presented) A device for the estimation
2 of the transfer function of a transmission channel in a receiving
3 system for a telecommunications network, the device comprising:

4 a memory means for storing channel coefficients
5 corresponding to a current slot (L) and at least one channel
6 coefficient corresponding to a slot (L + 1) subsequent to the
7 current slot (L);

8 interpolation means for reading from the memory means
9 first and second operands corresponding to known channel
10 coefficients and for writing into the memory means a value
11 corresponding to the arithmetic average between the first and
12 second operand, the value corresponding to a new channel
13 coefficient;

14 logic control means for addressing in reading and writing
15 (R/W) the memory means and for controlling the interpolation means
16 so as to perform through individual interpolation operations the
17 computation and the storage into such memory means of individual
18 channel coefficients, the logic control carrying out a series of
19 interpolation operations according to the method described in claim
20 17.

1 20. (previously presented) A radio base station of the
2 type comprising a Rake receiver for receiving signals coming from
3 mobile terminals and equipped with a device for the estimation of
4 the transfer function of a transmission channel through the
5 computation of a plurality of channel coefficients, the estimation
6 of the transfer function being performed according to the method
7 described in claim 17.

1 21. (previously presented) A mobile terminal of the
2 type comprising a receiver for the reception of signals coming from
3 a radio base station and equipped with a device for the estimation
4 of the transfer function of a transmission channel through the
5 computation of a plurality of channel coefficients, the estimation
6 of the transfer function being performed according to the method
7 described in claim 17.
